Car Insurance Claim Reports

Car Insurance Claim Dashboard

Introduction	General Notes	High Level Information about the claimants &..	Age group, Income & Travel Time. Occupati..	Consistent Claims, Cumulative increas..	Who (or) Which Car type is claiming high?	Claim Frequency D..
--------------	---------------	------------------------------------------------	---------------------------------------------	-----------------------------------------	-------------------------------------------	---------------------

There are 7647 car insurer details provided in the given dataset. No major abnormalities in the dataset.

Assumptions & Calculated Fields

1. Assume the data provided is for **2015**. Because, this forms the minimum & maximum age of a owner is 29 & 85 respectively. High distribution of data is between 50 and 70 which is valid to this dataset.
2. Age is calculated using the year 2015-'Birth' field.
3. One of the Car Age data is -3, never be the case. So, create a new field named '**Age of Car**' & update it to 3.
4. Create a new field **Total claim amount=Oldclaim+CIm Amt(current)**
5. Assuming the car owner is still driving and the '**Car Manufacture Year**' can be calculated using 2015-'YOJ' field.
6. Assuming number of claims is proportional to the number of accidents.
7. Create a new field '**Locale-Parent-Car-Use**' field with the below code.

```
case [Locale-Parent-Use Parameter]
when "UrbanCity" then [UrbanCity]
when "Parent1" then [Parent1]
when "Car Use" then [Car Use]
when "Gender" then [Gender]
END
```

So, whenever there is a change in the parameter condition, the reports gets pulled based on the field.

8. Create a field '**UrbanCity**' to classify the data just Urban or Rural.
9. Below are the fields created to understand the count of claims

```
# of claims in current year as well as in past --> IF [Oldclaim] !=0 AND [CIm Amt] !=0 THEN 1 ELSE 0
# of current claims --> IF [CIm Amt] =0 THEN 0 ELSE 1
# of NOT claimed --> IF [Oldclaim] =0 AND [CIm Amt] =0 THEN 1 ELSE 0
# of Old claims --> IF [Oldclaim] =0 THEN 0 ELSE 1
# of total claims --> IF [Oldclaim] =0 AND [CIm Amt] =0 THEN 0 ELSE 1
```

Similarly, for the percentage of claims, it can be calculated using appropriate (number of claims/total number of claims)*100 & rounded it to 2 decimals.

10. Convert the Measure fields to Dimension as & when required to plot the graph.
11. Create a binning fields appropriately for Age, Travel Time to understand the distribution.
12. Create the group for **Age (group)** field to group them in 5 ranges such as 29-35,36-45,46-55,56-70 and 71-85.

Parameters

1. Create a parameter '**Top N Claimants**' with the current value as 30 & associate it to the "Total Claim Amount" in a descending fashion of customer ID's.
2. Create a parameter '**Locale-Parent-Use Parameter**' with the string values of UrbanCity, Parent1, Car Use, Gender and associate to the '**Locale-Parent-Car-U..**
